

Step 8

Placing the water tank

A few things to notice when designing and placing the water tank.

1. It is important to place the water tank above the pump, as the water must run from the water tank to the pump by gravity.

2. Protect the water system from impurities and dirt by placing the return pipe above tank bottom.

3. Enable operators to flush out impurities and dirt by placing a drain in the absolute bottom of the water tank.
